

said disk at the same write timing, and said distance is measured at said sectors.

A² 9. (Amended) The magnetic disk drive system of claim 3, wherein the data for distance measurement is written in a position predetermined with reference to said servo information.

A³ 12. (Amended) The magnetic disk drive system of claim 3, wherein the head-distance measuring means obtains the position of the read head at the time when reading the written data for distance measurement, and computes said distance.

A⁴ 17. (Amended) The magnetic disk drive system of claim 13, wherein said position of the read head is detected by including the end position of the data for distance measurement in the search window opened at the read timing of the read head.

A⁵ 19. (Amended) The magnetic disk drive system of claim 13, wherein the read head performs the read operation at the same read timing for the plurality of said sectors in which the data for distance measurement has been written.

20. (Amended) The magnetic disk drive system of claim 1 or claim 2, wherein a plurality of positions, where said distances are measured, in the radial direction of the disk, are selected, and said distances, which are not measured, in relation to the other

positions, are determined by interpolation based on said distances measured in correspondence with said positions.

A 6 22. (Amended) The magnetic disk drive system of claim 1 or claim 2,
wherein the distance measured by the head-distance measuring means is stored.

A 7 25. (Amended) The magnetic disk drive system of claim 22, wherein said
distance is measured and stored when the power of the system is turned on.

26. (Amended) The magnetic disk drive system of claim 22, wherein said
distance is read out when the power of the system is turned on.

27. (Amended) The magnetic disk drive system of claim 22, wherein when
data is written on said disk, the write timing of the write head is determined by adding said
distance to the position where the data is written.
